

Response of May 26, 2005; Page 2
Application No. 10/045,830

1. (original): An image display system comprising:
a composite image source, a portion of the composite image source being
a first image source, and another portion of the composite image source being
a second image source;
a beamcombiner;
a single lens; and
a reflective element disposed to reflect the image of said second image source to said
beamcombiner;
wherein said first image source, said second image source, said beamcombiner, and said single
lens are so disposed as to present to a viewer a foreground image from one of said image
sources, and a background image from the other of said image sources, the background image
being presented at a greater distance from the viewer than the foreground image, at least one of
the images being a real image or virtual image presented by the single lens;
whereby the viewer perceives the foreground image and the background image as part of a scene
having depth.

2. (original): An image display system as in claim 1, further comprising an optical
element interposed between the beamcombiner and the viewer;
wherein said optical element is adapted to modify the aspect ratio of said foreground image and
said background image.

3. (original): An image display system comprising:
a foreground image source;
a background image source;
a beamcombiner; and
a mask interposed between said background image source and said beamcombiner;
wherein said foreground image source, said background image source, and said beamcombiner
are so disposed as to present to a viewer a foreground image from the foreground image source,
and a background image from the background image source, the background image being
presented at a greater distance from the viewer than the foreground image;
wherein said foreground image source and said mask are the same distance from said
beamcombiner; and

Application No. 10/045,830

wherein said mask displays a silhouette of foreground objects that appear coincident with said foreground image source,
whereby the viewer perceives the foreground image and the background image as part of a scene having depth, and
whereby said mask acts to mask portions of the background image from the viewer so as to improve presentation of foreground objects.

4. (original): An image display system as in claim 3, wherein said mask is a light valve.

5. (original): An image display system comprising:
a first image source;
a second image source;
a beamcombiner; and
a single lens;
wherein said first image source, said second image source, and said beamcombiner are so disposed as to present to a viewer a foreground image from one of said image sources, and a background image from the other of said image sources, the background image being presented at a greater distance from the viewer than the foreground image, and
wherein said lens is interposed between said first image source and the viewer so as to present at least one of the foreground image and the background image as a real image,
whereby the viewer perceives the foreground image and the background image as part of a scene having depth.

6-15. (canceled).
